

CSC212: Learning Java

D. Thiebaut
Fall 2014

Types

- In Java, everything has a type, **variables** and **functions**:
 - `int`
 - `double`
 - `boolean`
 - `String`

Examples

```
class Example {  
    public static void main(String[] args ) {  
        int i, j, k;  
        int year = 2014;  
        double x = 1.5;  
        double y = 0.00001;  
        double z = 1E-10;  
        boolean isValid = false;  
        boolean isEmpty = true;  
        String name = "Sophia";  
        String college = "Hampshire";  
    }  
}
```

Examples

```
class Example {
    public static void main(String[] args ) {
        int i, j, k;
        int year = 2014;
        double x = 1.5;
        double y = 0.00001;
        double z = 1E-10;
        boolean isValid = false;
        boolean isEmpty = true;
        String name = "Sophia";
        String college = "Hampshire";

        // print various quantities
        System.out.println( name + " likes " + college );
        System.out.println( "x+y = " + (x+y) );
    }
}
```

Functions have a type
too!

Examples

```
class Example {
    public static int times2( int x ) {
        return x * 2;
    }
    public static double times3( double x ) {
        return x * 3;
    }
    public static void main(String[] args ) {
        int i = 3;
        double x = 1.5;
        double y = 0.00001;

        // print various quantities
        System.out.println( "2*i = " + times2( i ) );
        System.out.println( "3*x = " + times3( x ) );
    }
}
```

Examples

```
class Example {
    public static int times2( int x ) {
        return x * 2;
    }
    public static double times3( double x ) {
        return x * 3;
    }
    public static void main(String[] args ) {
        int i = 3;
        double x = 1.5;
        double y = 0.00001;

        // print various quantities
        System.out.println( "2*i = " + times2( i ) );
        System.out.println( "3*x = " + times3( x ) );

        // what do you think?
        System.out.println( "3*i = " + times3( i ) );
        System.out.println( "2*x = " + times2( x ) );
    }
}
```

For-Loops

3-Components For-Loop

```
for (int i=0; i<10; i++ ) {  
    // body of loop  
}
```

3-Components For-Loop

**Initialize loop
counter**

**Test exit
condition**

**Update
loop counter**

```
for (int i=0; i<10; i++ ) {  
    // body of loop  
}
```

3-Components For-Loop

“start with...”

“repeat as long
as...”

“after every
loop, do...”

```
for (int i=0; i<10; i++ ) {  
    // body of loop  
}
```

Examples

```
for (int i=0; i<10; i++ ) {  
    System.out.println( i );  
}  
  
for (int i=10; i>=0; i=i-1 ) {  
    System.out.println( i );  
}  
  
for (int i=1; i<100; i=i*2 ) {  
    System.out.println( i );  
}  
  
for (int k=0; k<10; ) {  
    System.out.println( k++ );  
}  
  
for (int k=100; ;k++ ) {  
    System.out.println( k );  
    break;  
}
```

prints 0 1 2 ... 9

prints 10 9 8 7 ... 3 2 1 0

prints 1 2 4 8 16 32 64

does it print? If so, what?

Same question..

Test

```
for ( ; ; ){  
    System.out.println( "Hi!" );  
}
```

If-Statements

Syntax: 2 forms

```
if ( some boolean expression is true ) {  
    ...  
}  
else {  
    ...  
}
```

```
if ( some boolean expression is true ) {  
    ...  
}
```

Examples

```
if ( x < 10 ) ...
```

```
if ( x != 3 ) ...
```

```
if ( x > 10 && x <= 100 )... // and
```

```
if ( x != 0 || z == 3 )... // or
```

```
if ( !(x == 0 && z != 3) )... // de Morgan
```

While Loops

Syntax & Example

```
while ( some boolean expression is true ) {  
    ...  
}
```

```
int i = 1;  
while ( i < 100 ) {  
    System.out.println( i );  
    i = i * 2;  
}
```

Another Example

```
int i = 100;
boolean isValid = true;

while ( isValid ) {
    System.out.println( i );
    i = i - 3;
    isValid = ( i > 0 );
}
```

Comparing Strings

Example

```
String s1 = "Alex";  
String s2 = "Alex";  
  
if ( s1 == s2 ) {  
    System.out.println( "s1 equals to s2" );  
}  
else {  
    System.out.println( "s1 not equal to s2" );  
}
```

s1 equals to s2

Example

```
String s1 = "Ale";  
String s2 = "Alex";  
s1 = s1 + "x";  
if ( s1 == s2 ) {  
    System.out.println( "s1 equals to s2" );  
}  
else {  
    System.out.println( "s1 not equal to s2" );  
}
```

s1 not equal to s2

Solution, when
Comparing Strings...

```
String s1 = "Ale";  
String s2 = "Alex";  
s1 = s1 + "x"; // now s1 contains "Alex"  
if ( s1.equals( s2 ) ) {  
    System.out.println( "s1 equals to s2" );  
}  
else {  
    System.out.println( "s1 not equal to s2" );  
}
```

s1 equals to s2
